Melaleuca alternifolia (Maiden & Betch) Cheel
Myrtaceae

LOCAL NAMES
English (tea tree oil, narrow-leaved paperbark)

BOTANIC DESCRIPTION
Melaleuca alternifolia is a shrub, up to 7 m tall, with layered, papery bark.

Leaves variously arranged, scattered to whorled often on one branchlet; petiole 1 mm long; blade linear-acute, 10-35 mm x 1 mm, 3-veined (often only mid-vein visible), puberulous, glabrescent, dotted with oil glands visible with a lens.

Inflorescence a many-flowered, open to dense, upper-axillary or terminal spike; flowers solitary within each bract with tubular calyx up to 3 mm long and white corolla 2-3 mm long, stamens 30-60, white, clawed, pistil with 3-4 mm long style and capitate stigma.

Fruit a many-seeded, globose, woody capsule, 2-3 mm in diameter.

BIOLOGY
**ECOLOGY**

*M. alternifolia* occurs in the warm, wet east coast of Australia, often in swampy circumstances in dense impenetrable thickets. Mean summer maximum temperature is 27-31 deg. C, mean minimum 17-19 deg. C, mean winter maximum 18-21 deg. C, mean minimum 6-7 deg. C, and the species is frost sensitive. Leaf oil content is highest in warmer months.

**BIOPHYSICAL LIMITS**

Altitude: Up to 300 m

Mean temperature: 17-19 deg. C to 27-31 deg. C

Average annual rainfall: 1000-1600 mm.

Soil types: On a range of soils (pH 4.5-7).

**DOCUMENTED SPECIES DISTRIBUTION**

Native: Australia

Exotic:

The map above shows countries where the species has been planted. It does neither suggest that the species can be planted in every ecological zone within that country, nor that the species can not be planted in other countries than those depicted. Since some tree species are invasive, you need to follow biosafety procedures that apply to your planting site.

**Myrtaceae**

The map above shows countries where the species has been planted. It does neither suggest that the species can be planted everywhere, nor does it show the potential for the species to spread to natural areas. Since some tree species are invasive, you need to follow the necessary biosafety procedures that apply to your planting site.

**PRODUCTS**

*Essential oils:* The valuable essential oil, tea-tree oil or Australian melaleuca oil, is water- or steam-distilled from the leaves and small twigs. The oil is also of interest in the perfume industry, as it blends well with other oils while contributing its own distinctive note to soaps, deodorants and colognes.

The steam-distilled oil is white to pale yellowish-green, with a spicy aromatic odour, combining elements of cardamom, sweet marjoram with a camphoraceous slightly bitter, warm and spicy taste. The major components are terpinen-4-ol (up to 45%), gamma-terpinene (up to 25%), 1,8-cineole (3-17%) and limonene (up to 5%) (% not necessarily from the same sample).

**Medicine:** This oil is mainly used for medicinal and veterinary purposes as a popular antiseptic because of its ability to penetrate unbroken skin.

**SERVICES**
Melaleuca alternifolia (Maiden & Betche) Cheel
Myrtaceae

TREE MANAGEMENT

Seedlings potted when 4-6 weeks old and transplanted at a density of at least 35 000 trees/ha. Irrigation is very important.

Harvesting of leafy twigs starts 15-18 months after establishment and subsequently at 12-15 months intervals. Shoots are cut when less than 2 cm in diameter and at 5-10 cm above soil level.

Yield is about 8-10 t/ha, oil content 1-2%. Wild stands have been regularly harvested for 70 years; plantation life is not yet known.
